

LEYEcense

Intelligent Licence Monitoring

- Digitalization is accompanied by increased deployment of software. The licences required are often a major cost factor, diminishing the IT budget. That is why it is important to deploy and use licences efficiently. Here, the innovative LEYEcense monitoring tool of GNS Systems provides for transparency and demand-based use of licences.

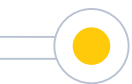

Seeing through the licence jungle

Expenditures for corporate software have continued to increase for years. To avoid additional expenditures, companies are striving for demand-optimized procurement and deployment of licences wherever possible. The more applications and employees that are active in the company, the more complex the use of licences becomes. It is often not clear how many licences various employees are using at the same

time, or which company departments even need licences. Are additional licences required, or can the number be reduced? Which models make the most sense: floating or single-user licences? The intelligent LEYEcense tool from GNS Systems addresses these issues. Historical and real-time data enable detailed analysis to determine actual demand. In an attractive web interface, dashboards create transparency and facilitate monitoring, as well as management, of licences.

IEYEcease features at a glance

Modules for easy management

IEYEcease is based on a modular and expanded systems architecture. It encompasses three basic modules: Analyzer, Observer and Operator. The analyzer includes a usage history. Via the Operator section, it is possible to perform several configurations for licence services. The observer module delivers licence data in real time.

Differentiated Analysis

The snapshot-based monitoring of IEYEcease indicates current usage of licences and enables a differentiated analysis for individual licences, users or departments. Customizable dashboards and reports allow documentation of licence demand.

Interaction with licence management

In order to create synergies, IEYEcease supports various licence management systems such as DSLS, FLEXIm, MS-X, LSTC and RLM.

Low requirements, maximum performance

IEYEcease requires Linux x64, e.g. via CentOS or RHEL. It encompasses an interactive web interface for all standard browsers such as Mozilla Firefox, Chrome, Safari, along with MS Internet Explorer and MS Edge.

Data Protection Made in Germany

IEYEcease complies to German data protection rules and fulfills the requirements of the EU General Data Protection Regulation. It also offers various security features, e.g. for user authentication.

Optimized licence use

An integrated alarm function can flag licences that have become available again or which have an unusually long term of use, i.e. if a user is inadvertently running an application without using it.

This enables licences to be made available to other users more quickly.

Your advantages with IEYEcease

- Higher transparency
- Reduced costs
- Optimized processes
- Comprehensive documentation
- Detailed demand analyses

ENTERPRISE

- Unlimited license servers and
- Unlimited license hours per year

ADVANCED

- Up to 30 license servers and
- Up to 100k license hours per year

BASIC

- < 5 license servers and
- < 15k license hours per year

- Consulting for your installation and integration
- Support via portal, E-mail, phone or remote
- Basic & Advanced: Support time = local working time
- Enterprise: 24x7
